Linear Mixed-Effects Models Using R: A Step-by-Step Approach (Springer Texts in Statistics) By Andrzej Galecki, Tomasz Burzykowski

Linear mixed-effects models (LMMs) are an important class of statistical models that can be used to analyze correlated data. Such data are encountered in a variety of fields including biostatistics, public health, psychometrics, educational measurement, and sociology. This book aims to support a wide range of uses for the models by applied researchers in those and other fields by providing state-of-the-art descriptions of the implementation of LMMs in R. To help readers to get familiar with the features of the models and the details of carrying them out in R, the book includes a review of the most important theoretical concepts of the models. The presentation connects theory, software and applications. It is built up incrementally, starting with a summary of the concepts underlying simpler classes of linear models like the classical regression model, and carrying them forward to LMMs. A similar step-by-step approach is used to describe the R tools for LMMs. All the classes of linear models presented in the book are illustrated using real-life data. The book also introduces several novel R tools for LMMs, including new class of variance-covariance structure for random-effects, methods for influence diagnostics and for power calculations. They are included into an R package that should assist the readers in applying these and other methods presented in this text.

Editorial Review

Review

From the reviews:

Overall, this is very well-written book that covers both LMs and LMMs. Most of the R codes have been checked and work well. The R package nlmeU created by the authors provides great convenience for readers to explore the data in the textbook. Given the extensive applications of LM and LMM, the book should be very appealing to the readers of *Technometrics*.

Technometrics, 56:1 2014

“This textbook is built as a step by step incremental description of a modelling tool used extensively in the analysis of hierarchical structured data sets. It is a balanced collection of concepts and examples from various research areas In addition to a great collection of theory and examples, a state of the art description of LMMs in R, the authors developed the R package nlmeU which contains the data sets and presented R code, making this book a milestone in its field.” (Irina Ioana Mohorianu, zBMATH, Vol. 1275, 2014)

“Linear Mixed-effects Models Using R by Andrzej Galecki and Tomasz Burzkowski, published by Springer is a book that covers in dept a lot of material on linear models. The book has clear instructions on how to program in R. ... This is a good reference book.” (Cats and Dogs with Data, maryannedata.wordpress.com, August, 2013)

From the Back Cover

Linear mixed-effects models (LMMs) are an important class of statistical models that can be used to analyze correlated data. Such data are encountered in a variety of fields including biostatistics, public health, psychometrics, educational measurement, and sociology. This book aims to support a wide range of uses for the models by applied researchers in those and other fields by providing state-of-the-art descriptions of the implementation of LMMs in R. To help readers to get familiar with the features of the models and the details of carrying them out in R, the book includes a review of the most important theoretical concepts of the models. The presentation connects theory, software and applications. It is built up incrementally, starting with a summary of the concepts underlying simpler classes of linear models like the classical regression model, and carrying them forward to LMMs. A similar step-by-step approach is used to describe the R tools for LMMs. All the classes of linear models presented in the book are illustrated using real-life data. The book also introduces several novel R tools for LMMs, including new class of variance-covariance structure for random-effects, methods for influence diagnostics and for power calculations. They are included into an R package that should assist the readers in applying these and other methods presented in this text.

Andrzej Ga?ecki is a Research Professor in the Division of Geriatric Medicine, Department of Internal Medicine, and Institute of Gerontology at the University of Michigan Medical School, and is Research Scientist in the Department of Biostatistics at the University of Michigan School of Public Health. He earned his M.Sc. in applied mathematics (1977) from the Technical University of Warsaw, Poland, and an M.D. (1981) from the Medical University of Warsaw. In 1985 he earned a Ph.D. in epidemiology from the Institute of Mother and Child Care in Warsaw (Poland). He is a member of the Editorial Board of the Open Journal of Applied Sciences. Since 1990, Dr. Galecki has collaborated with researchers in gerontology and

geriatrics. His research interests lie in the development and application of statistical methods for analyzing correlated and over- dispersed data. He developed the SAS macro NLMEM for nonlinear mixed-effects models, specified as a solution to ordinary differential equations. He also proposed a general class of variance-covariance structures for the analysis of multiple continuous dependent variables measured over time. This methodology is considered to be one of first approaches to joint models for longitudinal data.

Tomasz Burzykowski is Professor of Biostatistics and Bioinformatics at Hasselt University (Belgium) and Vice-President of Research at the International Drug Development Institute (IDDI) in Louvain-la-Neuve (Belgium). He received the M.Sc. degree in applied mathematics (1990) from Warsaw University, and the M.Sc. (1991) and Ph.D. (2001) degrees from Hasselt University. He has held guest professorships at the Karolinska Institute (Sweden), the Medical University of Bialystok (Poland), and the Technical University of Warsaw (Poland). He serves as Associate Editor of *Biometrics*. Dr. Burzykowski published methodological work on survival analysis, meta-analyses of clinical trials, validation of surrogate endpoints, analysis of gene expression data, and modelling of peptide-centric mass-spectrometry data. He is also a co-author of numerous papers applying statistical methods to clinical data in different disease areas.

Users Review

From reader reviews:

Vincent Baker:

Book is to be different for every single grade. Book for children until finally adult are different content. As you may know that book is very important usually. The book Linear Mixed-Effects Models Using R: A

Step-by-Step Approach (Springer Texts in Statistics) ended up being making you to know about other information and of course you can take more information. It doesn't matter what advantages for you. The reserve Linear Mixed-Effects Models Using R: A Step-by-Step Approach (Springer Texts in Statistics) is not only giving you far more new information but also to become your friend when you sense bored. You can spend your personal spend time to read your guide. Try to make relationship while using book Linear Mixed-Effects Models Using R: A Step-by-Step Approach (Springer Texts in Statistics). You never sense lose out for everything if you read some books.

Becky Pope:

This book untitled Linear Mixed-Effects Models Using R: A Step-by-Step Approach (Springer Texts in Statistics) to be one of several books in which best seller in this year, here is because when you read this reserve you can get a lot of benefit in it. You will easily to buy that book in the book retailer or you can order it through online. The publisher of this book sells the e-book too. It makes you quickly to read this book, as you can read this book in your Mobile phone. So there is no reason to your account to past this reserve from your list.

Ida Torres:

The book untitled Linear Mixed-Effects Models Using R: A Step-by-Step Approach (Springer Texts in Statistics) contain a lot of information on the item. The writer explains the girl idea with easy method. The language is very clear and understandable all the people, so do not worry, you can easy to read this. The book was authored by famous author. The author brings you in the new period of literary works. It is easy to read this book because you can continue reading your smart phone, or gadget, so you can read the book throughout anywhere and anytime. If you want to buy the e-book, you can wide open their official web-site in addition to order it. Have a nice go through.

Jonathan Smith:

Beside this particular Linear Mixed-Effects Models Using R: A Step-by-Step Approach (Springer Texts in Statistics) in your phone, it could possibly give you a way to get closer to the new knowledge or info. The information and the knowledge you may got here is fresh from the oven so don't become worry if you feel like an outdated people live in narrow commune. It is good thing to have Linear Mixed-Effects Models Using R: A Step-by-Step Approach (Springer Texts in Statistics) because this book offers to your account readable information. Do you occasionally have book but you do not get what it's all about. Oh come on, that wil happen if you have this inside your hand. The Enjoyable agreement here cannot be questionable, including treasuring beautiful island. So do you still want to miss this? Find this book and read it from right now!
